Spellman’s Bertan brand of 602C modular high voltage power supplies offer well regulated, fixed polarity outputs up to 20kV, that operate off a standard switch selectable 115/230Vac input. These fully enclosed modules are designed for bench top or OEM applications like spectrometers, detectors, imaging and electron beam usage. The output voltage can be controlled by either a local internal potentiometer or by a customer provided ground referenced signal for remote operation. Additionally ground referenced output voltage and current monitor signals are provided. A high voltage enable signal input allows remote control of the supply.

**TYPICAL APPLICATIONS**
- Spectrometers
- Detectors

**SPECIFICATIONS**

**Input Voltage:**
- 115Vac, ±10%, 50/60 Hertz @ 0.5 amp
- 230Vac, ±10%, 50/60 Hertz @ 0.25 amp

Input voltage is fused and switch selectable

**Output Polarity:**
Positive or negative, specify at time of order

**Output Voltage:**
See “model ratings” table

**Output Current:**
See “model ratings” table

**Voltage Regulation:**
- Line - ±0.001% of rated output voltage over specified input voltage range
- Load - ±0.002% of rated output voltage for a full load change

**Ripple:**
See “model ratings” table

**Stability:**
≤0.01% per hour, after a 1/2 hour warm up

**Temperature Coefficient:**
≤50ppm/°C

**Arc/Short Circuit:**
All units are fully arc and short circuit protected and will limit continuous short circuit output current to less than 110% of maximum rated output current.

**Operating Temperature:**
0°C to +50°C

**Storage Temperature:**
-40°C to +85°C

**Humidity:**
20% to 85% RH, non-condensing

**Interface Connector:**
9 pin Molex connector, mating connector and pins provided

**AC Input Line Connector:**
3 position terminal block

**Output Connector:**
10´ (3 meter) detachable HV cable is provided for units up to 5kV; 10kV through 20kV: 59˝ (1.5 meter) cable.

**Cooling:**
Convection cooled.

**Dimensions:**
5.0”H X 3.1”W X 8.7”D (128mm x 78mm x 220mm)

**Weight:**
≤6.75 pounds (3.1kg)
**INTERFACE CONNECTOR-P2**

IMPORTANT SAFETY PRECAUTIONS

SAFETY

High voltage power supplies must always be grounded.

Do not touch connections unless the equipment is off and the capacitance of both the load and power supply is discharged.

Allow five minutes for discharge of internal capacitance of the power supply.

Do not ground yourself or work under wet or damp conditions.

SERVICING SAFETY

Maintenance may require removing the instrument cover with the power on.

Servicing should be done by qualified personnel aware of the electrical hazards.

WARNING note in the text call attention to hazards in operation of these units that could lead to possible injury or death.

CAUTION notes in the text indicate procedures to be followed to avoid possible damage to equipment.

SECTION I –
INTRODUCTION/SPECIFICATIONS

1.0 SCOPE OF MANUAL
This manual is provided to assist the user in the installation and operation of the Bertan Series 602C, 603C, 605C, 606C and 612C modular high voltage power supplies. Statements will apply to models in all of the Series unless reference is made to specific models. For the protection of personnel and equipment, it is essential that this manual be thoroughly read prior to the installation and application of power.

1.1 PURPOSE OF EQUIPMENT
The Series 602C, 603C, 605C, 606C and 612C are families of regulated fixed output polarity modular high voltage power supplies. They provide exceptional performance in applications such as CRT’s spectrometers, detectors, medical imaging, image intensifiers, E-Beam, I-Beam, medical imaging and capillary electrophoresis (HPCE) systems.

1.2 DESCRIPTION
The units are fully enclosed and designed to easily satisfy system or bench top operation. A wide range of stable output voltages, up to 30kV are available. The output voltage is controlled locally by a minimum 15-turn potentiometer. Remote analog voltage of resistance programming is also available to the user as a standard feature. All units offer a 0 to +5Vdc analog monitor output proportional to the output current.

The Series 602C, 603C and 612C require an input of 115/230Vac (switch selectable) +10%, 50-60Hz. The Series 605C and 606C require a +28Vdc +10% input (or +24Vdc ±10% for units equipped with +24V Option). Each unit in the Series converts the applied power to a high voltage DC output. This output voltage is highly regulated and filtered. The high voltage assembly is fully encapsulated in silicone rubber for reliable, arc-free, stable operation.

SECTION II – OPERATION

CAUTION: THIS UNIT CAN STORE HAZARDOUS VOLTAGE! COMPLETELY DISCHARGE THE HIGH VOLTAGE TO GROUND BEFORE ATTEMPTING REMOVAL OF THE HIGH VOLTAGE CABLE.

2.1 INSTALLATION
All power supplies can be mounted in any position using the tapped holes in the base plate. The mounting screws should extend no more than ¼” into the unit. Series 602C and 605C require #8-32 mounting screws. Series 603C, 606C, and 612C require #10-32 mounting screws.

2.2 INPUT POWER
Input power is applied via the 3-terminal terminal strip for the Series 602C, 603C, and 612C or via the 9-pin connector for the Series 605C and 606C. The terminal or pin connections are as listed in Section 2.7.

CAUTION: APPLICATION OF INPUT POWER CAN IMMEDIATELY PRODUCE A HIGH VOLTAGE OUTPUT!

2.3 HIGH VOLTAGE CONTROL
There are three modes of controlling the high voltage. The user can select mode by making appropriate connections via the 9-pin Molex connector. All modes provide high voltage control from 0 to 100% (± 0.5%).

2.3.1 INTERNAL POTENTIOMETER CONTROL
See Section 2.7 for hook-up information. This will allow control of the high voltage output by means of the multi-turn potentiometer accessible via a hole in the cover.

2.3.2 EXTERNAL POTENTIOMETER CONTROL
See Section 2.7 for hook-up information. Connecting an external potentiometer (recommended value of 5kW) will control the high voltage output independently of the internal potentiometer setting.

2.3.3 EXTERNAL VOLTAGE CONTROL
See Section 2.7 for hook-up information. The output high voltage can be controlled by a 0 to +5Vdc analog signal.

2.4 HIGH VOLTAGE MONITOR
See Section 2.7 for hook-up information. A 0 to +5Vdc analog signal, which is proportional to the output high voltage. The monitor has a series impedance of 10kW.

2.5 OUTPUT CURRENT MONITOR
See Section 2.7 for hook-up information. A 0 to +5Vdc analog signal, which is proportional to the output current. The monitor has a series impedance of 10kW.

2.6 TRIP UNIT
See Section 2.7 for hook-up information. It provides the user with a means of remote turn ON/OFF. This input requires a contact closure to ground to turn off the high voltage. A NPN open collector transistor logic can also be employed. When no connection is made to this input the high voltage is enabled.

Note: To obtain local control using the internal potentiometer accessible at the top of the unit, jumper P2 pin 4 to pin 9.

For remote potentiometer control connect the remote potentiometer as follows:
CW terminal to P2 pin 5
CCW terminal to P2 pin 3
Wiper terminal to P2 pin 4

For remote 0 to +5V voltage programming, apply the input program voltage to P2 pin 4.

For remote TRIP connect P2 pin 8 to P2 pin 3

SECTION III PROGRAMMING OPTIONS

3.1 GENERAL
To provide additional flexibility and compatibility with earlier models, provision has been included to allow voltage programming of all models with a 0 to −5 Volt programming input. There are four different jumper-selectable modes for programming. The jumpers for selecting the required operating mode are located on PCB100 (the large PCB), easily accessible upon removal of the cover. Jumper locations are shown below in Table III-1.

The four modes are described below. The
first three modes apply to all Series 602C, 603C, 605C, 606C and 612C units. The last mode applies only to the Series 612C and is included only with Series 612C units ordered with the –5VPRO option.

3.2 STANDARD MODE
The unit is shipped in this configuration and operation is as described in the previous sections of this instruction manual. The unit can be controlled using the internal pot or programmed with a remote 0 to +5 Volt signal or controlled with a remote potentiometer.

3.3 -5 VOLT PROGRAMMING (for 0 to 100% output voltage) MODE
To achieve this operation the jumpers on PCB100 must be configured as shown in the chart below. In this mode the programming signal is applied to P2 pin 4, same as for Standard Mode, only now a 0 to –5 Volt programming input is required to achieve 0 to 100% output voltage programming. No jumpers should be attached to P2, the external connector. In this mode there is no internal control, the internal potentiometer is bypassed.

3.4 -5 VOLT PROGRAMMING (for 0 to 103% output voltage) MODE:
To achieve this operation the jumpers on PCB100 must be configured as shown in the chart below. In this mode the programming signal is applied to P2 pin 4, same as for Standard Mode. No jumpers should be attached to P2, the external connector.

In this mode the internal potentiometer is used to control the maximum programmed output voltage at –5 Volt programming input. With the potentiometer fully clockwise, the output will be 0 to 103% of maximum for a 0 to –5 Volt input. With the potentiometer turned up approximately half way, a 0 to –5 Volt input will produce a 0 to approximately 50% of maximum output voltage.

This mode is included to provide exact compatibility with some previous units. It also provides the user with a controllable upper limit on the programmed output for an input of –5 Volts.

3.5 SERIES 612C –5 VOLT PROGRAMMING MODE
Series 612C units ordered with the –5VPRO (-5 Volt Programming) option, include an extra 5 pin hexagonal connector (J3). The connector contains additional monitor outputs and a 0 to –5 Volt programming input. This option provides compatibility with earlier Series 612C models when used with –5 Volt programming. The mating connector for J3 is included and J3 connections are shown below in Table III-2.

In this mode the programming signal is applied to J3 pin A. A 0 to –5 Volt programming input is required to achieve 0 to 100% output voltage programming. No jumpers should be attached to P2, the external connector. In this mode there is no internal control, the internal potentiometer is bypassed.
TABLE III-1 PCB 100 JUMPER POSITIONS

**STANDARD MODE:**
Jumper pins 1 to 3, pins 5 to 7

3.3 -5 VOLT PROGRAMMING (for 0 to 100% output voltage) MODE: Jumper pins 1 to 2, pins 3 to 4

3.4 -5 VOLT PROGRAMMING (for 0 to 103% output voltage) MODE: Jumper pins 1 to 2, pins 3 to 5, and pins 6 to 8

3.5 ERIES 612C -5 VOLT PROGRAMMING MODE: Jumper pins 3 to 5, pins 4 to 6, and pins 7 to 8

TABLE III-2 J3 PIN CONNECTIONS
(Series 612C Option –5VPRO only)

PIN A: 0 to –5Volt programming input
PIN B: NC
PIN D: Output voltage monitor (0 to +5V for 0 to maximum HV output) PIN E: GND
PIN H: Output current monitor (0 to +5V for 0 to maximum current out)
SECTION IV – CIRCUIT DESCRIPTION
4.1 FUNCTIONAL DESCRIPTION
The 602C, 603C, and 612C employ a standard step-down transformer to obtain a nominal +28Vdc from the input ac power. The Series 605C and 606C obtain +28Vdc (+24Vdc for +24V Option models) from the input ac power. The circuit converts the +Vdc low voltage input DC power to a high voltage DC output. This output voltage is highly regulated and filtered and can be varied either by the local potentiometer control or through the REMOTE PROGRAM input.

An oscillator determines the frequency (approximately 20kHz) at which all amplification, high voltage transformation, rectification and filtering occurs. The amplification is a function of a control voltage which performs the function of control and regulation. A sample of the output voltage is compared against a reference voltage in the sensing circuit. The sensing circuit generates the control voltage to set and maintain a fixed high voltage output.

The encapsulated high voltage assembly includes a high voltage power transformer, rectifier or multiplier circuits, ripple filter and sensing circuits. These are all critical, custom designed and encapsulated components.

SECTION V – MAINTENANCE
5.1 GENERAL
The high voltage power supply should not require any maintenance or calibration. It is designed for reliable, trouble free operation. If any question should arise, contact the Bertan Customer Service Department for assistance or return authorization. Although it is felt that adequate information is provided in this manual, it is suggested that the unit be returned to the factory is service should become necessary.

The power supply can be returned to the factory for annual calibration and certification to its original specification. For traceability, a certificate will be issued, identifying the serial number of the unit calibrated and all test equipment used to perform the calibration. All measurements are traceable to the National Institute of Standards and Technology (N.I.S.T.). Contact the factory for additional details.

5.2 CLEANING
Cleaning of the power supply should only be performed with the supply disconnected from the ac power source. A soft cloth moistened with conventional ammonia-based cleaning agents will suffice for all exposed surfaces. The exposed shell of the HV connector should be cleaned with isopropyl alcohol.

If the supply is operated in a dusty environment, an accumulation of dust/debris may build-up inside the unit which may cause noisy operation (i.e., “ticking” or minor crackling) in the area of the HV cabling on the 10kV through 30kV models. The safest way to remove such debris is with compressed air. Ensure that no dust/debris is left behind in the insulative medium of the HV output connector after this cleaning operation. Such dust may be removed with a cotton swab moistened with isopropyl alcohol.
Spellman High Voltage Electronics (“Spellman”) warrants that all power supplies it manufactures will be free from defects in materials and factory workmanship, and agrees to repair or replace, without charge, any power supply that under normal use, operating conditions and maintenance reveals during the warranty period a defect in materials or factory workmanship. The warranty period is twelve (12) months from the date of shipment of the power supply. With respect to standard SL power supplies (not customized) the warranty period is thirty-six (36) months from the date of shipment of the power supply.

This warranty does not apply to any power supply that has been:
- Disassembled, altered, tampered, repaired or worked on by persons unauthorized by Spellman;
- subjected to misuse, negligent handling, or accident not caused by the power supply;
- installed, connected, adjusted, or used other than in accordance with the original intended application and/or instructions furnished by Spellman.

THE FOREGOING WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING THOSE OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

The buyer’s sole remedy for a claimed breach of this warranty, and Spellman’s sole liability is limited, at Spellman’s discretion, to a refund of the purchase price or the repair or replacement of the power supply at Spellman’s cost. The buyer will be responsible for shipping charges to and from Spellman’s plant. The buyer will not be entitled to make claim for, or recover, any anticipatory profits, or incidental, special or consequential damages resulting from, or in any way relating to, an alleged breach of this warranty.

No modification, amendment, supplement, addition, or other variation of this warranty will be binding unless it is set forth in a written instrument signed by an authorized officer of Spellman.

Factory Service Procedures

For an authorization to ship contact Spellman’s Customer Service Department. Please state the model and serial numbers, which are on the plate on the rear panel of the power supply and the reason for return. A Return Material Authorization Code Number (RMA number) is needed from Spellman for all returns. The RMA number should be marked clearly on the outside of the shipping container. Packages received without an RMA number may delay return of the product. The buyer shall pay shipping costs to and from Spellman. Customer Service will provide the Standard Cost for out-of-warranty repairs. A purchase order for this amount is requested upon issuance of the RMA Number (in-warranty returns must also be accompanied by a “zero-value” purchase order). A more detailed estimate may be made when the power supply is received at Spellman. In the event that the cost of the actual repair exceeds the estimate, Spellman will contact the customer to authorize the repair.

Factory Service Warranty

Spellman will warrant for three (3) months or balance of product warranty, whichever is longer, the repaired assembly/part/unit. If the same problem shall occur within this warranty period Spellman shall undertake all the work to rectify the problem with no charge and/or cost to the buyer. Should the cause of the problem be proven to have a source different from the one that has caused the previous problem and/or negligence of the buyer, Spellman will be entitled to be paid for the repair.
